

This site features rich nature and slopes of the ground.

Therefore, we aimed to design a building in the meantime, leaving as many trees as possible in order to coexist with rich trees. Curved walls will heal visitors.

And by making use of the slope, the first floor was raised half a floor, so that the basement of south side was set up on the ground.

In consideration of height restrictions, it has one floor underground and three floors above ground.

Considering structural rationality, we chose a uniform grid of RC frame structure. We thought that it is better to place a small room on the small span of the basement parking lot. The room of large span and high ceiling is placed on the south side.

The independence of each department was maintained. A distinction of visitor and management was made.

Each room and corridor have large and small windows so that trees can be seen from various places. With gentle stairs and slopes, everyone can easily approach.
