

Under the Big Trees

We propose to break down the big mass into 7 smaller volume according to their programs and connect them by a close circulation.

Benefit of our design:

Openness

Each volume is surrounded by green spaces and landscape. The openness allows nature light, wind circulation and view within the site.

Suitable environment for each program

Because each program is separated into individual volume, we can design each box in their max potential to provide the best space for its program. e.g light quality and GFA.

Simple accessibility

Because of the separation of all 7 programs/volume, user will be able to identify their destination easily along the close circulation.

Variety

By grouping all 7 volume together, users are able to look through volumes within the space and have a stronger sense of interaction with all 7 programs.

Security

High level of security was achieved by connecting all 7 volumes by a close glass circulation, because access from outside of the site is greatly limited.

Flexibility

Each box could be modified easily for future changes because each program has its own volume.

Context responsibilities

Because of the space within boxes, we could keep most of the existing plants, and the smaller volumes also have less visual impact on the surroundings compare with one bigger volume.

This open forest like proposal provides a space for everyone to interact.
